

FIRE RESISTANT SYSTEMS

SYSTEMS WITH MAINTAINED FUNCTIONALITY IN FIRE

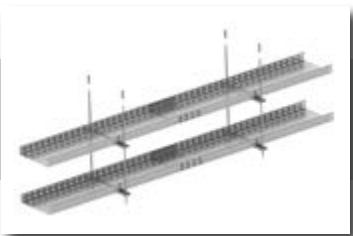

You stand for our success

New technologies guarantee the improvement and innovation of our products.
For you.

KOPOS KOLÍN a.s. is a leading manufacturer of wiring material with over 90 years of tradition. We currently produce over 5 000 products. The plastic category includes wiring boxes, trunkings, parapet trunkings, pipes, double wall protector conduits it is registered business mark KOPOFLEX® and KOPODUR® system, divided cable duct KOPOHALF®. We also include cable management systems such as cable trays, MARS cable trays, JUPITER®, wire trays or a stainless steel program. With the increasing demands on object safety, we have expanded and introduced systems to maintain functionality in the fire. Choose from a variety of carefully tested systems. The company considers it natural to produce products from halogen-free materials. By replacing lead in plastic mixtures and other environmental activities, we don't want to stand out in the environmental protection.

The products comply with the requirements of the European standards and are tested in the electrotechnical institutes. The company also owns the production technology used for the production of NEUTROSTOP shieldings. Their use is especially important where it is necessary to protect the environment from neutron radiation. We sell our products around the world through 10 daughter company. KOPOS KOLÍN a.s. is a holder of certificates according to ISO 9001 and ISO 14001, Czech Quality and Safety Certificate.

Basic terms and definitions

Requirements for building structures

Cable support systems must be installed on building structures whose fire resistance is at least equal to the fire resistance of the cable support system itself and whose design is adapted to the installation of cable support routes.

The manufacturer accepts no liability if the cable support system is installed on a building structure that does not meet the requirements for fire resistance.

Cable route

In the sense of ČSN 73 0895 cable routes are: cables and conductors for emergency circuits, high-current cables, insulated power conductors, lines for communication and communication equipment including busbars, terminal blocks, couplings, dividers, junction and installation boxes, supporting devices, holders, cable gratings, clamps, hangers, brackets, hinges, cable ladders, hooks, etc.

Cable support system

General name for supporting constructions used to store all equipment, including cables, which are related to the purpose or operation of cable routes in buildings, cable ducts, premises, shafts and bridges; the equipment material of cable ducts, shaft spaces and bridges must be made of products of reaction to fire class A1, A2 or B.

Installation cable duct

Cable duct exposed to fire from two to four sides with a defined time of fire resistance and maintaining the functionality of the cable route.

Cable route functionality

For metallic cables, it is met if no short circuit or interruption of the electric current flow occurs in the cable route during the test according to this standard. For data and optical cables, the transmission parameters must not deteriorate below the specified limit in addition.

Functional class Px-R or PHx-R

Time in minutes for which the cable route or switchboard retains its functionality in the event of a fire. The functionality class is called Px-R or PHx-R, where „x“ represents the operating time in minutes. It is proved by a test according to e.g. ČSN 73 0895, STN 92 0205, DIN 4102-12.

Standardized supporting construction

Cable support and fastening construction described as standardized in individual standards.

Non-standardized supporting construction

Cable support and fastening construction, which differs in one or more parameters from the standardized construction, eg:

- a) the type of material; or
- b) geometric dimensions (thickness of material, width of supporting construction, side height of the cable route, cross-section of supporting elements, the distance of attachment to the building structure, etc.) or
- c) the permissible mechanical load; or
- d) other parameters

Accredited fire laboratory

Testing laboratory accredited for the type of fire tests that are the subject of this standard.

Temperature scenarios

The test results obtained when testing cable routes at a higher temperature also apply to cable routes stressed by a lower temperature (e.g. if a cable route is included in functionality class P, the classification also applies to functionality class PH). So you can use our manufactured systems for resistance PH 120, PH 90, PH 60 and PH 30 while maintaining other conditions.

Surface finish

The systems can be supplied in various surface treatments (painting, hot-dip galvanizing), while this surface treatment does not affect the specified time of maintaining functionality in case of fire.

Protected escape route

Permanently free communication space leading to the exit to the open space, protected against the effects of fire.

Fire safety equipment and measures

Technical and organizational measures to reduce the theoretical intensity of a possible fire and to reduce the economic risk in the assessed building or its part (eg fire alarms, automatic stable fire extinguishing equipment, fire ventilation, constant supervision of fire protection units).

Fire safety of buildings

The ability of buildings to prevent the loss of life, health and property in the event of a fire: its layout, construction and material solutions, fire safety equipment and measures.

The fire risk of a building or its part is determined by the nature of the building, its functions, technical and technological equipment, construction, layout or urban design, fire safety measures, etc. and is expressed by the calculated fire load.

Maintaining the functional resistance of electrical cable systems in fire conditions: in the event of a fire, the thermal effect of the fire will not cause a short circuit or an open circuit in the cable system for a predetermined period of time.

Laws, decrees, standards

The requirements for the properties of cable support systems with integrated preservation of functionality in the event of fire result from the laws, decrees and standards. The issue of building safety in connection to the threat to persons in the event of a fire in our country is addressed by the General Building Act together with the Fire Protection Act. Government decrees and regulations then specify and generally regulate the technical requirements for construction, fire protection and prevention. Technical standards in relation to the fire safety of persons specify the general technical implementation procedures for guaranteed fire safety and durability. In addition to the technical design of buildings, they also deal with fire safety equipment and electricity supply.

Test of functional resistance of the system in the event of a fire

Test of the support system together with the installed cables.

This catalog would like to describe in detail the assembly of individual routes, the use of accessories, assembly elements, the application of power, data and optical fire-resistant cables.

Basic terms and definitions

Criterion Px-R, PHx-R

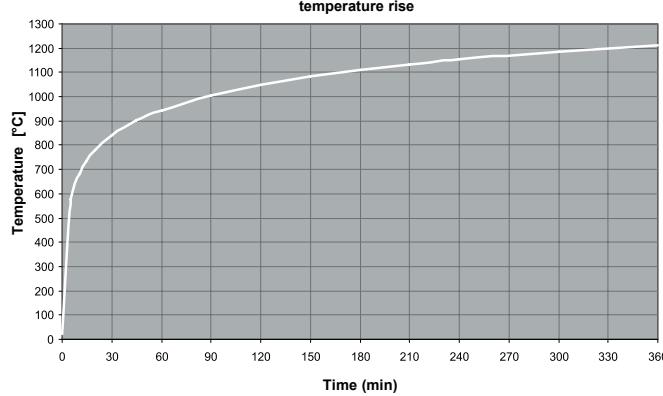

The maintenance of functional resistance is based on meeting the criterion of functional resistance.

Functional resistance classes

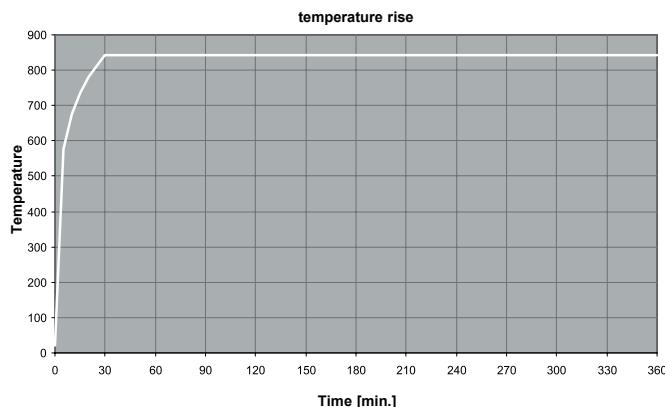

Cable routes and switchboards are classified into the functional resistance class listed in Table 1 according to the shortest time for which the Px-R functional resistance criterion is met using the temperature standard curve (temperature-time) according to ČSN EN 1363-1. It is also possible to use the criterion with the symbol PHx-R for the constant temperature of 842 °C. In this case, the temperature rises from the start of the test to 842 °C according to the standard temperature curve (temperature-time) and then remains the same, while the time counts from the start of the test.

Class	Class	Functional resistance in minutes
P15-R	PH15-R	≥ 15
P30-R	PH30-R	≥ 30
P45-R	PH45-R	≥ 45
P60-R	PH60-R	≥ 60
P90-R	PH90-R	≥ 90
P120-R	PH120-R	≥ 120

Standard temperature-time curve according to ČSN EN 1363 and according to DIN 4102 art. 12
temperature rise

Constant temperature curve with rise according to ČSN 73 0895.

Classification classes of individual standards

	ČSN 73 0895		DIN 4102-12	STN 92 0205
Temperature course of the test	Standard temperature-time curve [°C]	Constant temperature [°C]	Standard temperature-time curve [°C]	
Designation of fire functionality classes	P15-R	PH15-R	-	PS15
	P30-R	PH30-R	E30	PS30
	P45-R	PH45-R	-	PS45
	P60-R	PH60-R	E60	PS60
	P90-R	PH90-R	E90	PS90
	P120-R	PH120-R	E90	PS120

DIN 4102-12**	0	556	658	718	761	822	892	925	986	1029	1062	1090	1113	1133	1166	1194

* total temperature T in °C including ambient temperature +20 °C

** temperature rise v - vo in °C

Standard temperature-time curve:

temperatures as a function of time must be observed throughout the test according to the so-called „standard time curve“. It is an internationally used temperature profile according to ČSN EN 1363 / formula $T = 345 \log(8t+1) + 20$, where T = average furnace temperature in °C and t = time in minutes / also according to DIN 4102-2 / formula $v - vo = 345 \log(8t+1)$, where v = fire temperature in °C, vo = temperature of the test sample at the beginning of the test in °C, t = time in minutes. The temperature curve is based on the overall course of fire temperatures. Start of fire = phase of fire formation. In a very short time, the fire will fully develop = flash-over. The moment of flash-over and the fully developed fire is shown by the standard temperature-time curve.

Constant temperature action: The constant temperature action follows the stress according to the standard temperature/time curve when the temperature reaches 842 °C.

Maintaining functional resistance

The risk of fire can never be ruled out even with the help of various regulations and measures. Electrical wiring is exposed to heavy loads in the event of a fire. Especially in gathering areas, the supply of electricity for selected electrical equipment in protected escape and emergency routes must be maintained as long as possible. By means of cable support systems functioning in the event of fire, the supply of electricity is maintained for a specified period of time. The fire-resistant cable support system, manufactured by KOPOS KOLÍN a.s., meets the requirements of the relevant standards and regulations.

Before designing cable support systems (up to 1 kV) with functional fire resistance following is required on the basis of the fire report:

- know the level of fire safety of the fire section, which is determined on the basis of the calculation of fire risk, the construction system of the building and the height of the building or floor
- characterize the fire resistance of support constructions within the fire section, which do not ensure the stability of the building and which do not support or form fire dividing structures
- know the type of protected escape route
- design and secure methods of electricity supply from two independent sources used for fire protection of buildings (e.g. fire elevator, evacuation elevator, fire water booster pump, emergency lighting) so that in case of interruption of supply from one source, supplies are fully secured for the expected time of operation of the device from the second source
- eliminate the effects of surrounding installations on the cable support system
- select a suitable construction of the support system according to the level of required fire resistance
- select wires and cables ensuring the function and control of the equipment used for fire protection of buildings and determine their management or storage; electrical equipment that does not serve the fire safety of the building shall be fire-assessed if:
 - a) the wires and cables are routed freely without additional protection
 - b) the insulation weight of wires and cables or flammable parts of electrical wiring exceeds 0.2 kg per m³
- develop a „Protocol on the determination of external influences“ according to ČSN 33 2000-1 ed. 2 „Low-voltage electrical installations - Part 1: Basic aspects, determination of basic characteristics, definitions“, also with its „Opr.1“ and change „Z1“. The members of the commission are electrical designer, fire technician, safety technician and investor. Furthermore, depending on the focus of the building, there are technologist and specialists with demands on electricity, such as air conditioning, heating, etc. Members of the commission must also be specialists in the field for which the building is being built.

Fire resistance testing of cable support system constructions for integrated maintenance of functionality

The fire resistance test is intended to check the operation of the cable support system in case of fire and to prove that vital functions in the building (fire lift, evacuation lift, fire water booster pump, emergency lighting,

fire alarms, emergency exits) are maintained for a specified time. A uniform European standard for fire resistance and its testing does not yet exist. The German DIN 4102-12: „Preservation of the functionality of cable support systems“ is considered to be the reference standard.

In the Czech Republic, fire resistance testing of cable support system constructions is specified by the harmonized standard ČSN EN 1363. The new standard ČSN 73 0895 sets out the methods and conditions for testing the resistance of cable routes in fire conditions.

Certified constructions identical in design to the parameters of the standard are called „standardized“.

KOPOS KOLÍN a. s. manufactures fire-resistant systems according to the above-mentioned standards. These are JUPITER KZ cable trays with a sheet thickness of 1.5 mm, cable ladders with ladder cross-pieces at a distance of 150 mm and separate cable clamps.

Certified constructions different in design or dimensions from the above standard are referred to as „non-standardized“.

KOPOS KOLÍN a.s. strives to meet customers in terms of price and therefore offers fire-resistant systems at more affordable price. The cost of acquiring a fire-resistant route can be reduced by using sheet metal of a thinner thickness than specified in the standard, with a lower number of supports, etc. The standard allows testing of these routes, which are then referred to as „non-standardized“.

Non-standardized routes include routes formed by cable trays MARS and JUPITER with an integrated coupling and with a sheet thickness of 0.7; 0.75; 0.8; 1.0; 1.25 mm, cable ladder routes with a distance of cross-pieces of 300 mm, further metal support rails, systems with cable clamps, routes formed by steel pipes and other routes that differ in their parameters from standardized routes..

Cables for systems with maintained functionality in fire

Power and data safety cables with functional fire resistance must also pass fire resistance tests in accordance with valid regulations.

Fire resistance according to ČSN EN 1363-1: 2013

According to this standard, we have tested the KPZ-1_PO fire protection box in a non-supporting aerated concrete and plasterboard wall. The test results with a rigid standard support structure can also be applied to concrete or masonry dividers with a thickness and bulk density equal to or greater than the rigid standard support structure used in the test (mineral wool 100 kg/m³, YTONG block - bulk density 650 kg/m³).

KOPOS KOLÍN a.s. as a manufacturer recommends to follow the installation instructions in this catalog during the installation. In case of non-compliance, the manufacturer does not accept liability for any damage in case of fire.

Sample of completed marking of fire routes

Fire resistant system		KOPOS KOLÍN a.s.	
Installation performed: COMPANY		Classification class:	P 90-R
Cable trays system: KZI 60X100X0.75_S		Number of classification report: PK9-03-17-913-C-4	Year of installation: 2024

The OPT marking is used for routes that maintain functionality in the event of a fire (cable trays, cable ladders, boxes, etc.), always every 50 m at least.

STANDARDIZED SUPPORTING CONSTRUCTIONS ASSEMBLIES

Standardized supporting constructions

STANDARDIZED CONSTRUCTIONS

KOPOS KOLÍN a.s. manufactures fire-resistant systems in accordance with relevant standards and regulations. These are JUPITER KZ cable trays with a sheet thickness of 1.5 mm and KL cable ladders with cross-pieces at a distance of 150 mm. Furthermore, separate cable clamps and clamps of the PKC1 type.

standardized routes:

- cable trays
- cable ladders
- separate cable clamps

cable trays:

- maximum permissible width 300 mm (percentage of perforations 15 +/- 5%)
- side height 60 mm
- sheet thickness 1.5 mm
- cable weight max. 10 kg/m
- distance of supports max. 1 200 mm

cable ladders:

- maximum permissible width 400 mm
- side height 60 mm
- sheet thickness 1.5 mm
- cable weight max. 20 kg/m
- distance of cross-piece 150 mm
- distance of supports max. 1 200 mm

separate cable clamps

- width of separate cable clamp 15 +/- 5 mm
- distance of individual clamps max. 300 mm

cable clamps (PKC1) for profile rail

- fastening of the profile rail by max. 250 mm
- distance between profile rails max. 300 mm

Advantages of standardized supporting systems

It is possible to use cables with proven functionality in the event of a fire from any manufacturer.

- this feature is advantage in the implementation of the system and also in the expansion during operation. It does not restrict investors and implementation companies by taking cables from a specific manufacturer.
- more robust system and thus more secure results in proving the functionality of the cable route

Disadvantages

- higher purchase price
- higher installation time
- impossibility to use systems with a side height of 50 and 100 mm
- lower load of cable tray or ladder (max. 10 kg/m or 20kg/m)

INDEX

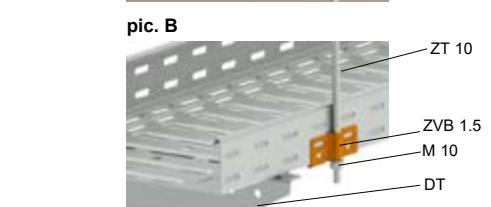

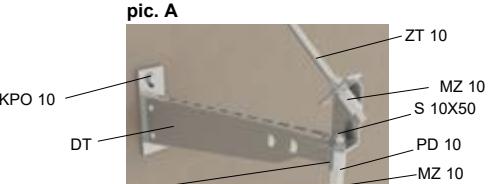

Standardized supporting construction - load 10 kg/m

The basis of the supporting construction is the DT holder with the DT OKO safety eye. The DT holder is anchored to the base material using KPO 10 anchors. The threaded rod ZT 10, which is secured at the top by a nut M 10 and at the bottom by a nut MZ 10 and washers PD 10, goes through DT OKO. The upper tray must be fixed to the wall by threaded rod and two pieces of VS 41X45 at an angle of 45°. The KZ tray is fastened to the DT holder using NSM 6X10 bolts.

In the case of one story route, the mounting part VS 41X45 is fastened to the bracket at the end of the holder DT + DT OKO by bolts S 10X50, nut MZ 10 and washers PD 10 (see pic. A).

The ends of the securing threaded rods can be anchored to the ceiling instead of the wall. When anchoring ZT to the ceiling, it is possible to use DT and secure the free ends with ZT 10 and ZVB 1.5 parts mounted at a maximum distance of 100 mm from the free end of DT (see pic. B).

Marking of fire routes by OPT label is always done after at least 50 m of the route.

Permissible technical parameters of the route

load for anchoring		
trapezoidal ceiling	DSOS	12 kg/pcs
concrete	KBS 6X35	60 kg/pcs
	KPOZ 8	100 kg/pcs
I profile	US	250 kg/pcs

Standardized supporting construction - load 20 kg/m

The basis of the supporting construction is the MP 41X21 mounting profile mounted on ZT 8 threaded rods. The threaded rods are attached to the base material using KPOZ anchors. The mounting profile is anchored on the threaded rods by M 8 nuts and PVL 8 washers. The cable ladder is fastened to the mounting profile using NSM 6X20 bolts and PVL 6 washer.

Marking of fire routes by OPT label is always done after at least 50 m of the route.

Permissible technical parameters of the route	
spacing of mounting points	max. 1200 mm
maximum load	20 kg/m
cable ladder side height	60 mm
cable ladder width	150 - 400 mm
cable ladder sheet thickness	1,5 mm

Cable manufacturer approved:

It is possible to use cables of any manufacturer with proven functionality in the event of a fire with the standardized supporting cable constructions.

Cable ladders - KL 60... PO assembly on the wall

load for anchoring		
concrete	KPO 10	236 kg/pcs

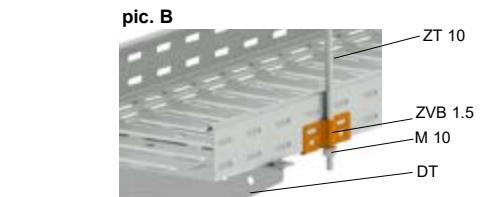

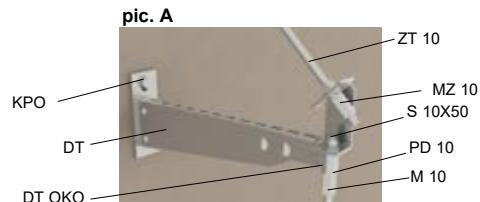

Standardized supporting construction - load 20 kg/m

The basis of the supporting construction is the DT holder with the DT OKO safety eye. The DT holder is anchored to the base material using KPO 10 anchors. The threaded rod ZT 10, which is secured at the top by a nut M 10 and at the bottom by a nut MZ 10 and washers PD 10, goes through DT OKO. The upper tray must be fixed to the wall by threaded rod and two pieces of VS 41X45 at an angle of 45°. The cable ladder is fastened to the DT holder using NSM 6X10 bolts.

In the case of one story route, the mounting part VS 41X45 is fastened to the bracket at the end of the holder DT + DT OKO by bolts S 10X50, nut MZ 10 and washers PD 10 (see pic. A).

The ends of the securing threaded rods can be anchored to the ceiling instead of the wall. When anchoring ZT to the ceiling, it is possible to use DT and secure the free ends with ZT 10 and ZVB 1.5 parts mounted at a maximum distance of 100 mm from the free end of DT (see pic. B).

Marking of fire routes by OPT label is always done after at least 50 m of the route.

Permissible technical parameters of the route

spacing of mounting points	max. 1200 mm
maximum load	20 kg/m
cable ladder side height	60 mm

Cable ladders - KL 60... cable ladder assembly - vertical installation

Standardized supporting construction - load 20 kg/m

The cable ladder is attached to the base material using KLSU clamps attached to the side of the ladder in a maximum span of 1200 mm using NSM 6X10 bolts. The installation on the base material is done by using KPO 8 anchors.

The cable located in the cable ladder must be mechanically fixed with PKC1 clamps every 300 mm at least. If the length of the vertical cable route is greater than 3500 mm, it is necessary to create a relieving elbow or use the KPS cable clamps cover (pg. 17 and 63).

Marking of fire routes by OPT label is always done after at least 50 m of the route.

Permissible technical parameters of the route	
spacing of mounting points	max. 1200 mm
maximum load	20 kg/m
distance between individual routes	100 mm (the minimum distance for placing KPS cover)
cable ladder side height	60 mm
cable ladder width	150 - 400 mm

List of products for one mounting point

		page
KLSU	2	139
KPO 8	2	145
NSM 6X10	4	148
PKC1	according to the cables amount	142

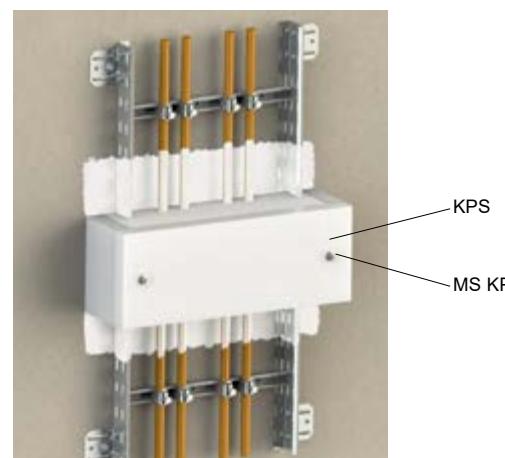

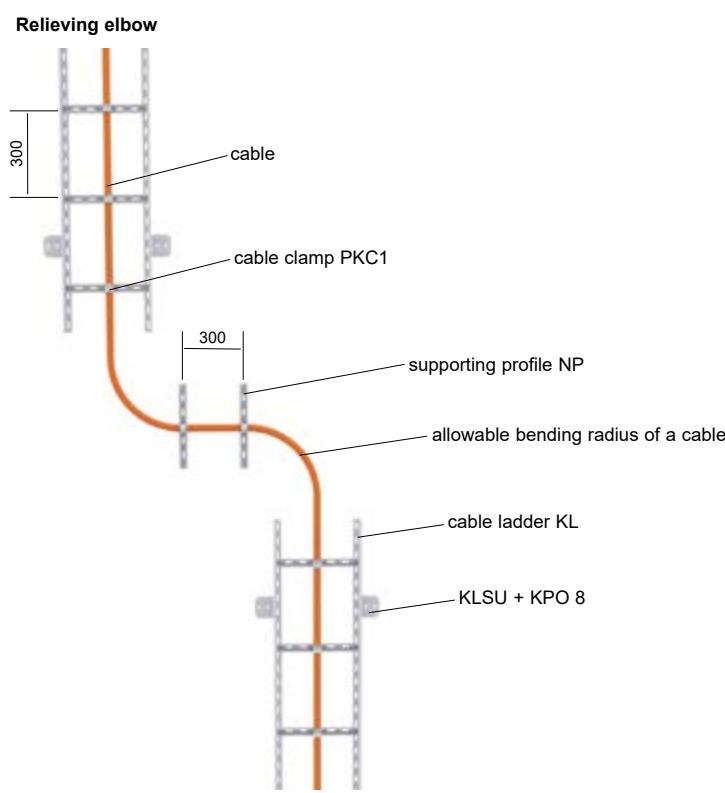

Cable manufacturer approved:

It is possible to use cables of any manufacturer with proven functionality in the event of a fire with the standardized supporting cable constructions.

According to the standards, the vertical route created by the cable ladders KL 60X... S (F) is understood as a clamp for individual cables. The cable ladders are connected using S 60X200 coupling. Fixing of the cables with individual clamps in span of 300 mm is understood as a standardized supporting construction. Because the vertical route may be part of a non-standardized supporting construction, it is always necessary to use cables from manufacturers who have been certified for installation on the non-standardized part of the cable route. The route must be anchored before going to the vertical part.

KPS - replacement for relieving elbow

Instead of the relieving elbow, it is possible to use the KPS cable clamps cover (pg. 17 and 63).

Certification according to: ČSN 73 0895, DIN 4102-12, STN 92 0205

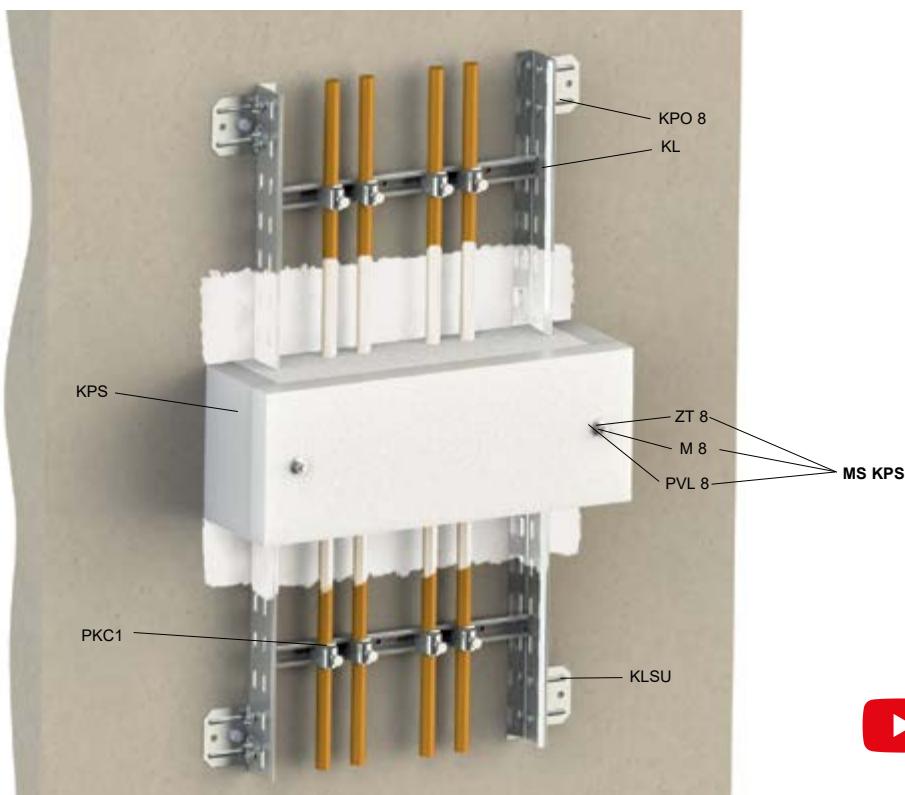

the above values of fire resistance also apply to the corresponding classifications PH90-R, PH60-R, PH45-R, PH30-R and PH15-R

KPS cable clamps cover
up to a cable ladder width of up to 400 mm - tension relief after every 3,5 m

Type of KPS
KPS 160X150
KPS 160X200
KPS 160X300
KPS 160X400
KPS 200X150
KPS 200X200
KPS 200X300
KPS 200X400

Standardized supporting construction

The KPS cable clamps cover is attached to the base material using ZT 8 threaded rods, PVL 8 washers, M8 nuts and KPOZ 8 anchors (MS KPS assembly set). KPS is thermal protection for the clamps (PKC1, OMEGA, DOBRMAN, 67xx_PO), in which the cable is fixed and thus clamps maintains its mechanical function even in fire conditions. In order for the cover to function safely, it must be installed on vertical routes consisting of cable ladders, OMEGA, DOBRMAN or 67xx_PO clamps every max. of 3,5 m. The cover is placed symmetrically with the axis of the cable route cross-piece. The cover does not function as a fire seal. Marking of fire routes by OPT label is always done after at least 50 m of the route.

The KPS cover can be used as a replacement for the relieving elbow.

For KPS 200... it is necessary to order the fire protection putty KPS-STOP_PO (2 kg pack).

KPS-STOP_PO - 2 kg pack is sufficient to coat approx. 4 pieces of KPS 200X... in a thickness of 1 mm in dry condition.

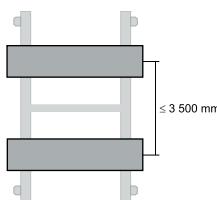

For KPS 160... the putty is included in the package.

Assembly description

Secure the cables to each cross-piece with clamps. Drill the holes in the wall according to the spacing of the holes in the KPS clamps cover and insert the anchors into them. Mount threaded rods to the anchors. Attach the clamps cover and lightly tighten over the washers. Insert one layer of insulating cotton wool after another. Always carefully seal the area around the cables with pieces of cotton wool. Now tighten the nuts fixing the cover firmly and carefully coat the area around the cables and the edges of the insulation wool with the supplied cement.

aerated concrete	KHP + SB 6.3X45	4 kg/pcs

Cable clamps (PKC1) with profile rail placement on the ceiling and wall

Standardized supporting construction

The basis of the supporting construction are NP mounting profiles. The anchoring spacing of the profiles is max. of 250 mm. Anchoring is done using KPO 6 anchors or concrete screws SB 6.3X35. The cables are fixed to the individual profiles using PKC1 clamps. A maximum of 3 cables with proven functionality in the event of a fire can be placed in a single PKC1 clamp.

Due to the test performed on the horizontal installation, it is possible in compliance with ČSN 73 0895 to use this route for vertical (ascending) routes. When using a vertical route longer than 3500 mm, it is necessary to create a relieving elbow or use the KPS cable clamps cover. For more extensive installation, you can use the NP 30X15X1.20 profile while maintaining all the conditions above. NP 30X15X1.20 can be cut to any length.

Marking of fire routes by OPT label is always done after at least 50 m of the route.

Permissible technical parameters of the route	
spacing of mounting points	max. 250 mm
maximum load	load of inserted cables (max. 3 cables in a single clamp)

aerated concrete	KHP + SB 6.3X45	4 kg/pcs
metal sheet	STP 4.2X13	2 kg/pcs
nailing	KHB, KHO	by inserted cable

Standardized supporting construction

The basis of supporting construction are clamps of the 6706–6725 series fastened to the base material using fire-resistant concrete screws SB 6.3X35 or SB 6.3X45. The screws are screwed into pre-drilled holes in concrete or solid masonry with a diameter of 5 mm. The size of the clamps must be chosen with regard to the diameter of the installed cable. Only one cable of the corresponding diameter can be installed in one single clamp, two cables of the corresponding diameter in a double clamp. Two 6706-6725 clamps can be installed under one screw to create a route for two cables of different diameters. The clamps can also be used for vertical routes. When using an vertical route longer than 3500 mm, it is necessary to create a relieving elbow or use a KPS cable clamps cover.

We also now supply double clamps 6708D_PO, 6710D_PO and 6716D_PO which also meet the maintenance in fire for 90 minutes.

The STP 4.2X13 screw is used for anchoring to the trapezoidal metal sheet. A KHP dowel with the SB 6.3X45 concrete screw or a KVP screw is used for anchoring in aerated concrete. Holeless clamps (POBD) can be nailed with suitable nails.

Marking of fire routes by OPT label is always done after at least 50 m of the route.

Explanation of configurations

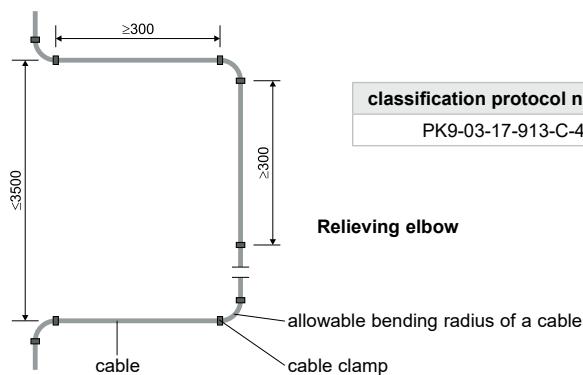

- 67xxPO, POGMT - one-sided clamps with a hole of Ø 6 mm
- 67xxPOBD - one-sided clamps without hole (for nailing)
- 67xxD - double clamps with a hole of Ø6 mm

Permissible technical parameters of the route	
spacing of mounting points	max. 300 mm
maximum load	only one cable in a single clamp

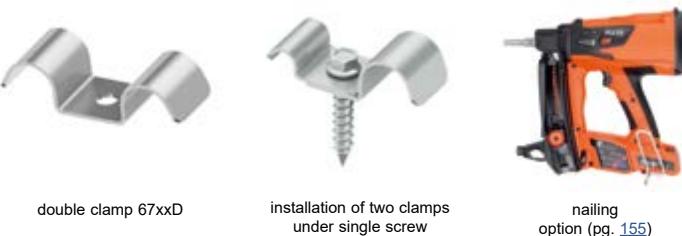

Cable manufacturer approved:

It is possible to use cables of any manufacturer with proven functionality in the event of a fire with the standardized supporting cable constructions.

load for anchoring		
concrete	SB 6.3X35	362 kg/pcs
	KPO 6	100 kg/pcs
aerated concrete	KHP + SB 6.3X45	4 kg/pcs

Standardized supporting construction

The basis of the supporting construction are OMEGA 52xx clamps, which are anchored at a distance of 300 mm between each other in the base material using SB 6.3X35 screws. Concrete screws are screwed into pre-drilled holes in concrete or solid masonry. It is also possible to use the KPO 6 anchor for fixing the clamps. OMEGA clamps can also be anchored on threaded rods. This placement is an advantage in the case of insulating the supporting walls with thermal insulation. Anchoring of threaded rods is performed through thermal insulation directly on the building structure with proven functionality in the event of a fire. Due to the test performed on the horizontal installation, it is possible in compliance with ČSN 73 0895 to use this route for vertical (ascending) routes. When using a vertical route longer than 3500 mm, it is necessary to create a relieving elbow or use the KPS cable clamps cover.

A KHP dowel with the SB 6.3X45 concrete screw is used for anchoring in aerated concrete.

Standardized supporting construction

The basis of the supporting construction are clamps of the DOBRMAN 52xx D type, which are fixed onto the ZT 6 threaded rod or KPO 6 anchors at a distance of max. 300 mm between each other. KPO 6 is hammered into pre-drilled holes in concrete or solid masonry. The cable is then inserted into the installed clamps. Due to the test performed on the horizontal installation, it is possible in compliance with ČSN 73 0895 to use this route for vertical (ascending) routes. DOBRMAN clamps can also be fixed to threaded rods. This placement is an advantage in the case of insulating the supporting walls with thermal insulation. Anchoring of threaded rods is performed through thermal insulation directly on building structures with proven functionality in the event of a fire. When using a vertical route longer than 3500 mm, it is necessary to create a relieving elbow or use a KPS cable clamps cover. A KHP dowel with a SVD screw is used for anchoring in aerated concrete.

Marking of fire routes by OPT label is always done after at least 50 m of the route.

NON-STANDARDIZED SUPPORTING CONSTRUCTIONS

NON-STANDARDIZED CONSTRUCTIONS

KOPOS KOLÍN a.s. offers more cost-effective fire-resistant systems in an effort to meet customers in terms of price. The cost of a fire-resistant route can be reduced by using a sheet thinner than the standardized and by a more sophisticated cable tray shape solution and anchoring system. The standard allows testing of these routes, which are then referred to as non-standardized.

Non-standardized routes include, for example, routes formed by cable trays MARS and JUPITER with an integrated coupling and with a sheet thickness of 0.7; 1.0; 1.25 mm, cable ladder routes with a distance of 300 mm between cross-pieces, greater distance of supporting metal rails, routes formed by steel and plastic pipes, clamps, parapet channels, etc.

non-standardized routes:

- trays with integrated coupling and with a sheet thickness of 0.7; 0.75; 0.8; 1.0 and 1.25 mm
- cable trays with a side height of 50, 60 and 100 mm
- cable ladders with a side height of 60 and 110 mm
- cable ladders with cross-pieces span of 300 mm
- wire trays
- support rails
- steel and plastic pipes
- halogen-free rigid pipes
- OMEGA and DOBRMAN cable clamps
- SD 2 grouped cable holder
- separate cable clamps
- wiring box KSK
- parapet channels and trunkings

The system includes those systems that have been tested as a whole.

In the systems it is necessary to use only cables with proven functionality in the event of a fire from the manufacturer with whom the specific route was tested, e.g. PRAKAB PRAŽSKÁ KABELOVNA s.r.o., NKT s.r.o., Kablo Vrchlabí s.r.o. apod.

Advantages:

- lower price
- time saving during assembly
- greater possibilities in mounting systems
- possibility of higher load
- greater distances between supports

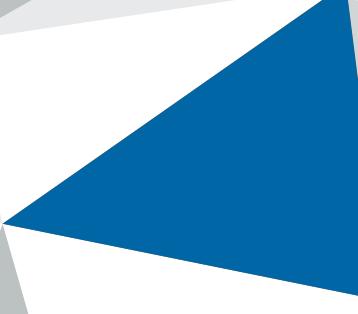

Disadvantages:

- the necessity to use only those types of cables with which the assembly has been tested

load for anchoring		
concrete	KPO 10	236 kg/pcs

Non-standardized supporting constructions - load 10 kg/m

The basis of the supporting construction are LTS holders with STS reinforcement attached to the base material using KPO 10 anchors. The cable trays are equipped with an integrated coupling and, when inserted into each other, connected by the NSM 6X10 bolts. The tray must be also attached to the DT holder using the NSM 6X10 bolts.

Marking of fire routes by OPT label is always done after at least 50 m of the route.

Classification of fire resistance according to:

DIN 4102-12
ČSN 73 0895
STN 920205

Permissible technical parameters of the route	
spacing of mounting points	max. 1500 mm
maximum load	10 kg/m
cable tray side height	60 mm
cable tray width	50 - 400 mm
cable tray sheet thickness	1,0 mm

MARS ASSEMBLIES

Connection of fire resistant trays NKZI, NKZIN - MARS

NKZI cable trays with maintaining functionality in the event of a fire are made of metal sheet with a thickness of 0.7 to 1.25 mm. The NKZI cable tray is connected using an integrated coupling, which is part of the tray, and using NSM 6X10 bolts. For non-perforated trays, it is necessary to drill holes for NSM 6X10 bolts in the bottom of the tray.

cable tray width	62 - 250 mm
cable tray sheet thickness	1,25 mm

Non-standardized supporting constructions - load 10 kg/m

The basis of the supporting construction are DT holders attached to the base material using KPO 10 anchors. The cable trays are equipped with an integrated coupling and, when inserted into each other, they are connected using NSM 6X10 bolts. The tray must be attached to the DT holder using NSM 6X10 bolts.

Marking of fire routes is always done after at least 50 m of the route.

Classification of fire resistance according to:

DIN 4102-12
ČSN 73 0895
STN 920205

Cable ladders - KL 60... assembly of cable ladders - vertical route

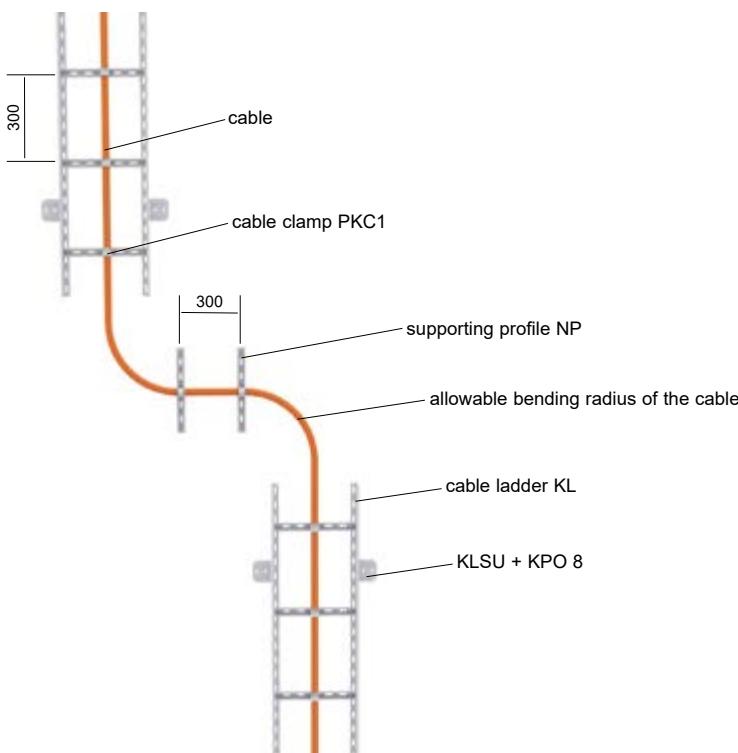

load for anchoring

concrete KPO 8 187 kg/pcs

Relieving elbow

Non-standardized supporting constructions - load 20 kg/m

The cable ladder is attached to the base material using KLSU brackets attached to the side of the ladder in a maximum span of 1200 mm using NSM 6X10 bolts. The installation on the base material is performed using KPO 8 anchors.

The cable placed in the cable ladder must be mechanically fastened with PKC1 clamps at least every 300 mm.

If the length of the vertical cable route is longer than 3500 mm, it is necessary to create a relieving elbow or use a KPS cable clamps cover (pg. 17 and 63).

Marking of fire routes by OPT label is always done after at least 50 m of the route.

Permissible technical parameters of the route

spacing of mounting points	max. 1200 mm
maximum load	20 kg/m
distance between individual routes	100 mm (minimum distance for KPS cover placement)
cable ladder side height	60 mm
cable ladder width	150 - 600 mm

List of products for one mounting point

		page
KLSU	2	139
KPO 8	2	145
NSM 6X10	4	148
PKC1	according to the cables amount	142

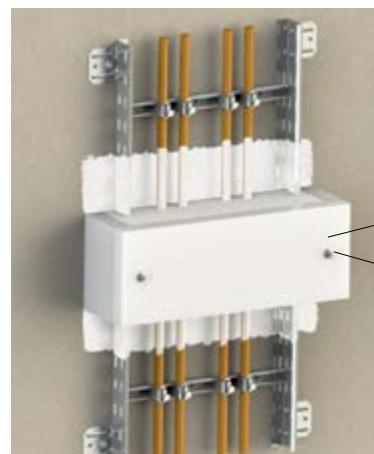

Cable manufacturer approved:

Due to the fact that KL cable ladders can be placed on this route, the classification of the route depends on the specific type of cable ladder tested on the ceiling. The classification can be found in the specification of a specific route.

Because the vertical route may be part of a non-standardized supporting construction, it is always necessary to use cables from manufacturers who have been certified for installation with the non-standardized part of the cable route. The route must be anchored before going to the vertical part.

KPS - replacement for relieving elbow

Instead of the relieving elbow, it is possible to use the KPS cable clamps cover (pg. 17 and 63).

Certification according to: ČSN 73 0895

the above values of fire resistance also apply to the corresponding classifications PH90-R, PH60-R, PH45-R, PH30-R and PH15-R

KPS 200X300_PO
KPS 200X400_PO
KPS 200X500_PO
KPS 200X600_PO

Standardized and non-standardized supporting constructions

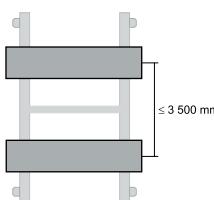

The KPS cable clamps cover is attached to the base material using ZT 8 threaded rods, PVL 8 washers, M8 nuts and KPOZ 8 anchors (MS KPS assembly set). The KPS provides thermal protection for the PKC1 clamps in the cable tray or NP profile, as well as for the OMEGA, DOBRMAN and 67xx_PO clamps in which the cable is fixed and thus fulfils its mechanical function in case of fire. In order for the cover to function safely, it must be installed on vertical routes consisting of cable ladders, OMEGA, DOBRMAN or 67xx_PO clamps every max. of 3,5 m. The cover is placed symmetrically with the axis of the cable route cross-piece. The cover does not function as a fire seal. The insulating putty is no longer included. The putty must be ordered separately. This is the KPS-STOP_PO putty knife, which is supplied in 2 kg buckets (the package is sufficient to coat approx. 4 pieces of KPS with 1 mm thickness in dry condition). Marking of fire routes by OPT label is always done after at least 50 m of the route. For a standard load-bearing structure, the width of KPS is 200X... max. 400 mm.

The KPS cover can be used as a replacement for the relieving elbow.

Assembly description

Fasten the cables to each partition with clamps every 30 cm. Drill the holes in the wall according to the spacing of the holes in the KPS clamps cover and insert the anchors into them. Mount threaded rods to the anchors. Attach the clamps cover and lightly tighten over the washers. Insert one layer of insulating cotton wool after another. Always carefully seal the area around the cables with pieces of cotton wool. Now tighten the nuts fixing the cover firmly and carefully coat the area around the cables and the edges of the insulation wool with the supplied cement (min. 1 mm thickness in dry condition).

vertical route

Cable ladders KL assembly of cable ladders - vertical route of two cable ladders KL

load for anchoring		
concrete	KPO 10	236 kg/pcs

Non-standardized supporting constructions - load 20 kg/m

Cable ladders are attached by KLSU bracket to DT holders placed on the wall using KPO 10 anchors. The maximum mounting point spacing is 1200 mm. The mutual distance of cable trays placed on DT holders is 200 mm. It is advantageous to use the assembly where it is necessary to install a large number of cables.

According to the standards, the vertical route created by the cable ladders KL 60X... S (F) is understood as a clamp for individual cables. The cable trays are connected using S 60X200 coupling. Fixing cables with individual clamps with spacing of 300 mm is understood as a standardized supporting construction. Because the vertical route may be part of a non-standardized supporting construction, it is always necessary to use cables from manufacturers who have been certified for installation with the non-standardized part of the cable route.

The route must be anchored before going to the vertical part.

For the vertical route, a relieving elbow or tensile relief using KPS (pg. 63) must be created every 3500 mm. In the case of the assembly of two cable trays, two KPS can be used on top of each other or against each other.

Marking of fire routes by OPT label is always done after at least 50 m of the route.

Classification of fire resistance according to:

ČSN 73 0895

Permissible technical parameters of the route	
spacing of mounting points	max. 1200 mm
maximum load	20 kg (for each cable ladder)
distance between individual routes	200 mm
cable ladder side height	60 mm
cable ladder width	150 - 600 mm

**Wire trays with integrated DZI coupling - side height 60
ceiling assembly using the central hanger DZCZ/B**

load for anchoring		
trapezoidal ceiling	DSOS	12 kg/pcs
concrete	KBS 6X35	60 kg/pcs
	KPOZ 8	100 kg/pcs
I profile	US	250 kg/pcs

Non-standardized supporting constructions - load 6 kg/m

The ZT 8 threaded rod is suspended from the ceiling using KPOZ 8 fire-resistant anchors. The supporting element of this assembly is a pair of DZCZ/B central hinges, which are fixed to the threaded rods by two M 8 nuts and PD 8 washers. The hangers must always be placed in the middle of the wire trays in the longitudinal axis. For fire resistance, the connection by integrated couplings is fastened with DZS/B bolts (according to the width of the tray).

Marking of fire routes by OPT label is always done after at least 50 m of the route.

Classification of fire resistance according to:

Wire trays - DZI 60 assembly of wire trays - vertical route

load for anchoring		
concrete	KPO 8	100 kg/pcs

Non-standardized supporting constructions - load 20 kg/m

The wire tray is anchored to the base material using the DZNP/B profile in the maximum span of 1200 mm. DZNP/B is anchored using KPO 8 anchors.

The cable placed in the wire tray must be mechanically fixed with PKDZ1 clamps at least every 300 mm. If the length of the vertical cable route is longer than 3500 mm, it is necessary to create a relieving elbow or use a KPS cable clamps cover.

Permissible technical parameters of the route

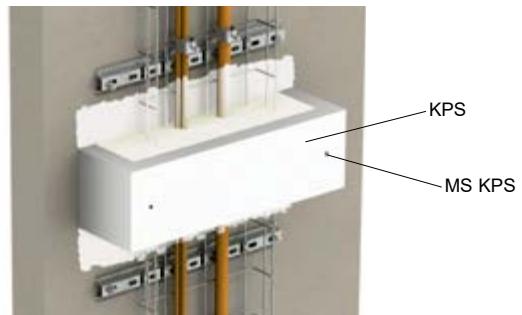

spacing of mounting points	max. 1200 mm
maximum load	20 kg/m
distance between individual routes	100 mm (minimum distance for KPS cover placement)
cable tray side height	60 mm
cable tray width	50 - 600 mm

NON-STANDARDIZED SUPPORTING CONSTRUCTIONS

CABLE CLAMP

METAL PIPE

PLASTIC PIPE

SUPPORT RAIL

PARAPET CHANNEL

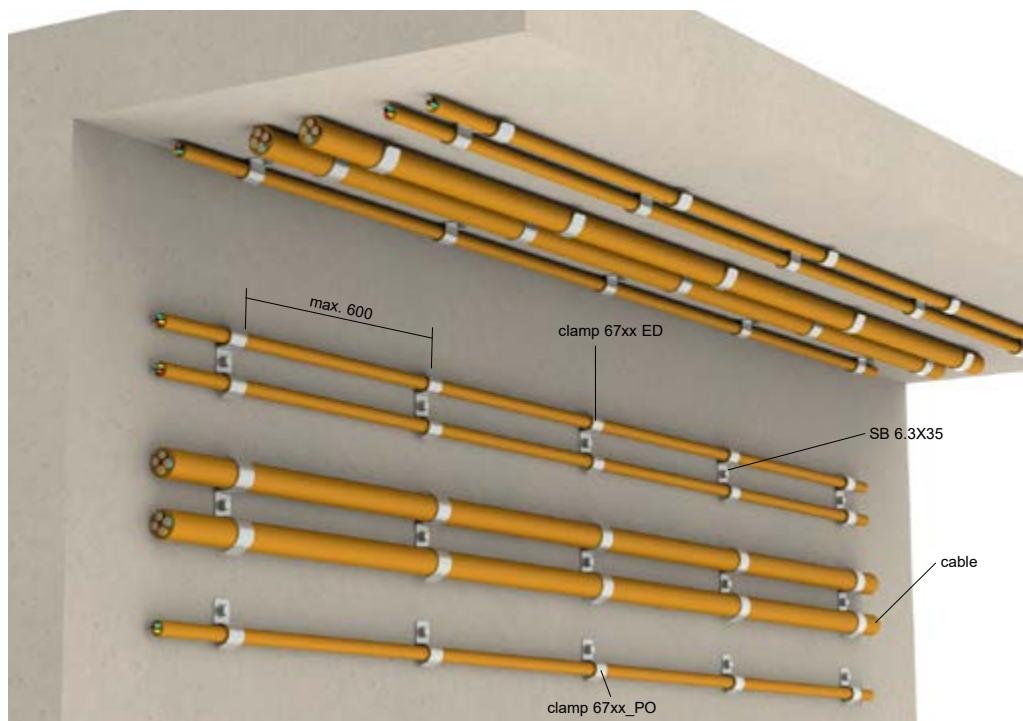

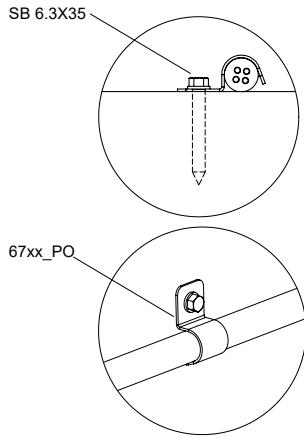

AND OTHERS

Separate cable clamps 67xx_PO placement on the ceiling and wall

load for anchoring		
concrete	SB 6.3X35	362 kg/pcs
	KPO 6	100 kg/pcs
aerated concrete	KHP + SB 6.3X45	4 kg/pcs
	KHP + KVP	
metal sheet	STP 4.2X13	2 kg/pcs
	nailing	by inserted cable

Non-standardized supporting construction

The basis of the supporting construction are clamps of the 6706 - 6725 series fastened to the base material using fire-resistant concrete screws SB 6.3X35 or SB 6.3X45. The screws are screwed into pre-drilled holes with a diameter of 5 mm in concrete or solid masonry. The size of the clamps must be chosen with regard to the diameter of the installed cable. Only one cable of the corresponding diameter can be installed in one single clamp, and two cables of the corresponding diameter in a double clamp. Two 6706 - 6725 clamps can be installed under one screw, creating a route for two cables of different diameters. The clamps can also be used for vertical routes. When using a vertical route longer than 3500 mm, it is necessary to create a relieving elbow or use a KPS cable clamps cover.

We also now supply double clamps 6708D_PO, 6710D_PO and 6716D_PO which also meet the maintenance in fire for 90 minutes.

Clamps without holes can be shot using a suitable nailgun.

Marking of fire routes by OPT label is always done after at least 50 m of the route.

Classification of fire resistance according to: DIN 4102-12, ČSN 730895, STN 920205

OMEGA 52xx cable clamps
assembly of OMEGA clamps - placement on the ceiling and wall

kg
by inserted cables

load for anchoring		
concrete	SB 6.3X35	362 kg/pcs
	KPO 6	100 kg/pcs
aerated concrete	KHP + SB 6.3X45	4 kg/pcs

Non-standardized supporting construction

The basis of the construction are OMEGA 52xx series clamps, which are placed at a span of 600 mm using SB 6.3X35 screws. These screws are screwed into pre-drilled holes with a diameter of 5 mm in concrete or solid masonry. It is also possible to use the KPO 6 anchor to fix the clamps. The cable is then inserted into the installed clamps.

The base material must meet the conditions for maintaining the functionality of the structure in the event of a fire. OMEGA clamps can also be attached to threaded rods. This placement is an advantage in the case of insulating the supporting walls with thermal insulation. Anchoring of threaded rods is performed through thermal insulation directly to the building structure with proven functionality in the event of a fire. The route can also be used as vertical.

A KHP dowel with SB 6.3X45 concrete screw is used for anchoring in aerated concrete.

Marking of fire routes by OPT label is always done after at least 50 m of the route.

Classification of fire resistance according to: DIN 4102-12, ČSN 730895, STN 920205

vertical route

**SD 2 grouped cable holder
assembly of grouped holder on wall or ceiling**

3 - 6

load for anchoring		
concrete	SB 6.3X35	362 kg/pcs
	KPO 6	100 kg/pcs
aerated concrete	KHP + SB 6.3X45	4 kg/pcs

**Non-standardized supporting constructions - load 6 kg/m**

The construction is based on SD 2 grouped holders anchored to the base material using SB 6.3X35 concrete screws or KPO 6 anchors. The minimum distance between the individual grouped holders is 300 mm, max. 600 mm. Cables can be installed in the clamps up to the maximum permitted load.

The route formed by the SD 2 holders cannot be used as vertical.

A KHP dowel with SB 6.3X45 concrete screw is used for anchoring in aerated concrete.

Marking of fire routes by OPT label is always done after at least 50 m of the route.

Steel pipes 60xx assembly of steel pipes - horizontal placement on the ceiling and wall

load for anchoring		
concrete	SB 6.3X35	362 kg/pcs
	KPO 6	100 kg/pcs
aerated concrete	KHP + SB 6.3X35	4 kg/pcs
	KHP + KVP	4 kg/pcs

Non-standardized supporting construction

The basis of the supporting construction are steel pipes of the 60xx series fixed to the base material using OMEGA type clamps. OMEGA 52xx clamps must be fastened using the SB 6.3X35 concrete screws. These screws are screwed into pre-drilled holes with a diameter of 5 mm in concrete or solid masonry. It is also possible to use the KPO 6 anchor to fasten the clamps. A fire-resistant steel pipe is then attached to the installed clamps, into which a cable of the corresponding diameter can be inserted. The maximum spacing of the installed clamps is 1200 mm. A maximum of 1 cable can be inserted into the pipe.

To connect ČSN pipes, it is necessary to order couplings that will replace the aluminum couplings supplied with the pipes. Couplings must also be replaced within pipe accessories (e.g. elbows, etc.)

Pipe assemblies cannot be used to create vertical routes.

Marking of fire routes by OPT label is always done after at least 50 m of the route.

Classification of fire resistance according to:

**Halogen-free rigid pipes 15xx HF
assembly of pipes and DOBRMAN clamps - horizontal placement on the ceiling and wall**

load for anchoring		
concrete	KPO 6	100 kg/pcs
	KPOZ 6 + ZT 6	80 kg/pcs
aerated concrete	KHP + SVD	5 kg/pcs

Non-standardized supporting construction

The basis of the supporting construction are halogen-free rigid pipes 15xxHF (40xxHF, 80xxHF) and DOBRMAN 52xx D clamps. DOBRMAN clamps are screwed onto ZT6 or KPO 6 at a distance of max. 600 mm from each other.

KPO 6 is hammered into pre-drilled holes with a diameter of 5 mm in concrete or solid masonry. The cable is then inserted into the installed pipes. The base material must meet the conditions for maintaining the functionality of the structure in the event of a fire.

DOBRMAN clamps can also be attached to threaded rods. This placement is an advantage in the case of insulating the supporting walls with thermal insulation. Anchoring of threaded rods is performed through thermal insulation directly to the building structure with proven functionality in the event of a fire. A KHP dowel with SVD screw is used for anchoring in aerated concrete. The tubes are available in both black and grey colour.

Marking of fire routes by OPT label is always done after at least 50 m of the route.

Pipes assemblies cannot be used to create vertical routes.

concrete	VPO 6.5X40	60 kg/ pcs
----------	------------	---------------

Metal support rail wall and ceiling assembly with support rail

Non-standardized supporting construction

The basis of the supporting construction are type 5820 support rails attached to the base material using VPO 6.5X40 fire-resistant screws. The cable is attached to the rail using metal tightening belts SPK 200X4.6 at a maximum spacing of 600 mm.

The tightening belt is attached under the rail and pulled to close to the cable. The excess end of the tightening belt must be removed.

The route can be used on the wall, ceiling and also as a vertical route, the maximum length of the vertical route is 3500 mm. When using a longer route, it is necessary to create a relieving elbow. Only one cable can be used for installation on one fire-resistant support rail.

The maximum spacing of the anchors is 600 mm.

Marking of fire routes by OPT label is always done after at least 50 m of the route.

Classification of fire resistance according to:

DIN 4102-12

	2	FR-220-11-AUNS	JR-024-22-NURS

Instead of the relieving elbow, it is possible to use the KPS cable clamps cover (pg. [17](#)), this solution is equivalent in terms of standard. Due to the fire classification of the KPS cover, the classification of the route formed by the cable clamps is reduced to 60 minutes. Cables placed under the KPS cover must be firmly fixed using PKC1 clamps (pg. [142](#)) anchored on NP profiles (pg. [138](#)). The supporting profile must be anchored with two KPO 8 anchors (pg. [145](#)) at its edges. The maximum distance of the anchors must be 250 mm. It is necessary to use three KPO 8 anchors to fasten the NP 350 profile.

**Halogen-free parapet channels PK 110X65 D HF
assembly of parapet channels - placement on the wall**

Non-standardized supporting construction

The basis of the supporting construction are halogen-free parapet channels PK 110X65 D HF equipped with a metal partition PEP 60/K. The partition is attached to the wall through the parapet channel using KPO 6 anchors with a spacing of 400 mm (every other marked hole in the metal partition is used). The parapet channel can be used to create a route with requirements for maintaining functionality in the event of a fire in areas where emphasis is placed on higher aesthetic requirements. The condition for maintaining the functionality of the route is placing the corresponding cables in the metal partition, not elsewhere in the trunking area. It is possible to place cables in the lower part of the trunking without maintaining functionality in the event of a fire.

The route cannot be used as vertical.

Marking of fire routes by OPT label is always done after at least 50 m of the route.

Classification of fire resistance according to:

Fire resistant instrument box in a non-support wall

The KPZ-1_PO fire resistant box is intended for fire dividers formed by fireproof plasterboard or for aerated concrete structures. The box is designed for electrical distribution with a voltage up to 400 V. Its advantage is that the inlet openings are made of softened material, which ensures airtight passage between the box and the cable or pipe installed in it. Foaming material is applied to the outer and inner side of the box, which, in the event of a fire, closes the mounting hole - thus ensuring the integrity and insulation of the fire dividers even at the location of the devices. Its use prevents the spread of fire between individual fire sections in the event of a fire. The box can be used in non-load-bearing fire walls made of 2x12.5 mm SDK with or without mineral wool, or in aerated concrete structures.

The diameter of the drill for installation is 73 mm. The mounting screws are equipped with a three-way thread and metal flap for quick installation. The use of this box is mainly in buildings with an increased need for protection of people and property in the event of a fire.

Permissible technical parameters of the route	
max. number of assembled boxes	horizontally - max. of 3 pcs of boxes next to each other, vertically - max. of 2 pcs below each other
max. protection	IP 30

Fire resistant instrument boxes in a non-support wall

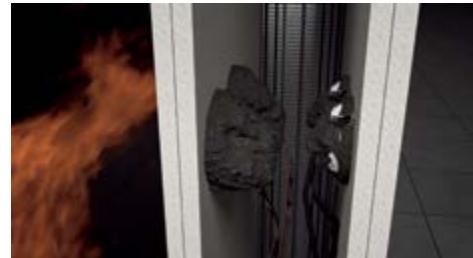

Fire-resistant boxes are designed for fire partition walls made of fire-resistant plasterboard. The boxes are designed for electrical installations with a voltage of up to 400 V. They have the advantage that the inlets are made of a softened material which ensures airtightness between the box and the cable or pipe installed in it.

A foaming material is on the outside of the boxes, which in the event of a fire will seal the mounting hole - this ensures the integrity and insulation of the fire partitions and the location of the devices. Their use therefore prevents the spread of fire and smoke in the event of a fire. The boxes can be used both in fire-resistant partitions with or without mineral wool. With wool the boxes provide integrity and insulation for up to 90 minutes, i.e. EI 90, without wool up to EI 60. The drill diameter for the installation of single boxes is 73 mm.

The mounting screws are equipped with a three-way thread and metal flap for quick installation.

The box can be used in non-load-bearing fire walls made of 2x12.5 mm SDK with or without mineral wool, or in aerated concrete structures.

The use of this box is mainly in buildings with an increased need for protection of people and property in the event of a fire.

Wiring fire boxes for power cables

HF

VIDEO

KSK 100_PO, KSK 125_PO10, KSK 175_PO16

Standardized and non-standardized supporting constructions

The wiring box is attached to the base material using fire-resistant anchors or concrete screws, which are part of the package. Spacers supported by washers are screwed onto the installed anchors. A support rail with ceramic terminals is then mounted on the posts. The support rail is fastened to the support posts using nuts. The wiring box can be attached to the JUPITER cable tray using the MDS mounting plate (pg. 113).

For easy routing of cables, the box is equipped with softened inputs providing IP 66 protection. The entire box is made of halogen-free material.

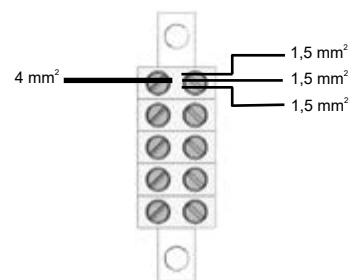

The boxes can be part of both standardized and non-standardized routes. Information on the types of cables that can be used (or without restrictions) can be found in the individual system assemblies that remain functional in the event of a fire.

Separate ceramic terminals serve only as a spare part for KSK boxes with functionality in the event of a fire. Single and double terminals can be interchanged, provided that the other parameters of the KSK boxes do not change. **Separate ceramic terminals do not form a fire resistant route.**

Marking of fire routes by OPT label is always done after at least 50 m of the route.

Wiring fire box with double terminal

VIDEO

KSK 125_2PO6, KSK 175_2PO10

Standardized and non-standardized supporting constructions

The wiring box is attached to the base material using the concrete screws that are included in the package. Depending on the type of cable, the corresponding inlets are created in the box and the cables are connected. The last step of the assembly is the installation of the cover lid, which is fixed with 4 screws in the corners. The wiring box can be attached to the JUPITER cable tray using the MDS mounting plate (pg. 113).

The advantage of the terminal, which is an integral part of the box, is the fact that it is possible to use 4 wires fastened with screws to connect the wires to one potential. For easy routing of cables, the box is equipped with softened inputs providing IP 66 protection. The entire box is made of halogen-free material.

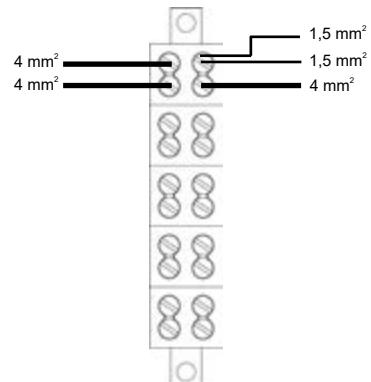

The boxes can be part of both standardized and non-standardized routes. Information on the types of cables that can be used (or without restrictions) can be found in the individual system assemblies that remain functional in the event of a fire.

Separate ceramic terminals serve only as a spare part for KSK boxes with functionality in the event of a fire. Single and double terminals can be interchanged, provided that the other parameters of the KSK boxes do not change. **Separate ceramic terminals do not form a fire resistant route.**

Wiring fire box with thermal fuse

KSK 125_PO6P, KSK 175_PO10P

Standardized and non-standardized supporting constructions

The wiring box is attached to the base material using the concrete screws that are included in the package. Depending on the type of cable, the corresponding inlets are created in the box and the cables are connected. The last step of the assembly is the installation of the cover lid, which is fixed with 4 screws in the corners. The wiring box can be attached to the JUPITER cable tray using the MDS mounting plate (pg. 113).

According to the diagram, a thermal fuse is inserted in the ending line of the circuit. In the event of a fire, where there is a risk of a short circuit from the terminal equipment, which does not have the ability to maintain functionality in the event of a fire, the thermal fuse disconnects this ending secondary line from the mains, thus ensuring its functionality. The thermal value of the non-reversible fuse is 150 °C, the maximum current load is 10 A. The fuse supplied by KOPOS KOLÍN a.s. can be used in all boxes with functional integrity while maintaining all other parameters (components).

For easy routing of cables, the box is equipped with softened inputs providing IP 66 protection. The entire box is made of halogen-free material.

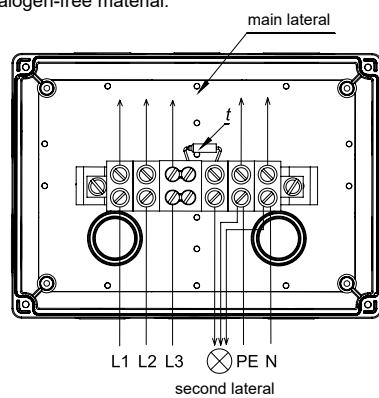

The boxes can be part of both standardized and non-standardized routes. Information on the types of cables that can be used (or without restrictions) can be found in the individual system assemblies that remain functional in the event of a fire.

Separate ceramic terminals serve only as a spare part for KSK boxes with functionality in the event of a fire. Single and double terminals can be interchanged, provided that the other parameters of the KSK boxes do not change. **Separate ceramic terminals do not form a fire resistant route.**

cover fixture

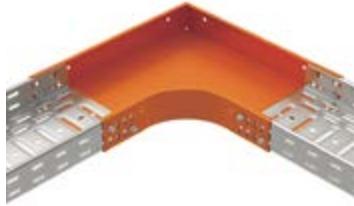

- It is used for screwless attachment of the cover to the tray and accessories..
- The cover fixture is attached to the cover and the side of a tray at the location of the hole and is lightly pressed against it so that the fixture lock fits into the hole.
- Use for perforated and non-perforated trays, holes are created in non-perforated trays especially for fixtures.
- Can also be used for MARS cable trays.

reduction piece

- The connection is made using NSM 6X10 bolts.
- Used to create an additional branch of an unequal T-piece or cross.
- The reducing part is delivered in 1 piece, but it is always used in pairs
- It is possible to use VOH horizontal branch cover to cover the route with the reduction piece.
- Accessories can also be used for cable ladders.
- The following applies to accessories for standardized supporting constructions:
 - side height 60 mm

cover fixture

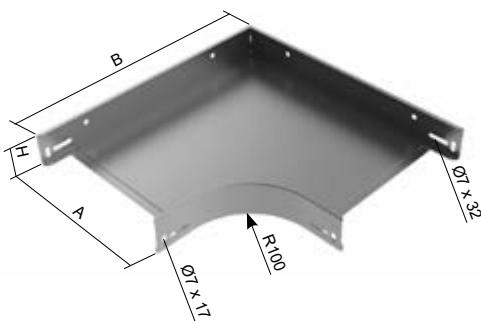

- For non-perforated NKZIN trays, it is only necessary to fix the cover at the connection point between the tray and the accessories.
- For perforated trays, it is possible to use bolts to fasten the fixtures along the cable tray.
- NSM 6X10 bolts must be ordered separately for this mounting method.
- The listed items can also be ordered in a painted version.
- Can also be used for JUPITER cable trays.

reduction piece

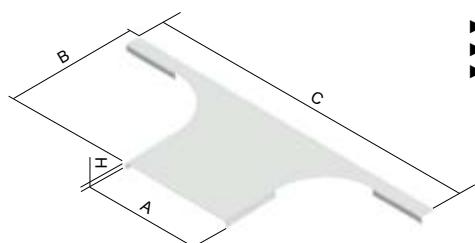

- The connection is made using NSM 6X10 bolts.
- Used to additionally create a branch in instead of T-piece or cross.
- Always use in pairs.
- These items can also be ordered in a painted version.

partition

- The partition is fastened with NSM 6X10 bolts
- The partition is used for spatial separation of cables and routing of various networks and functions. At the same time, it serves to separate individual types of lines in terms of electrical compatibility. For this purpose, it is recommended to use a cover and thus create an enclosed shielded space.
- The items can also be ordered in a painted version.

cable ladders

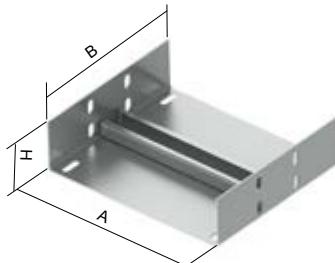

cable ladder 60

- The distance between the cable ladders cross-pieces for standardized constructions is 150 mm.
- KPBSKL couplings and NSM 6X10 bolts are intended for connection.
- JUPITER cable tray accessories can be used for ladders.
- We are able to provide fiber cement boards on request.

cable ladder 60

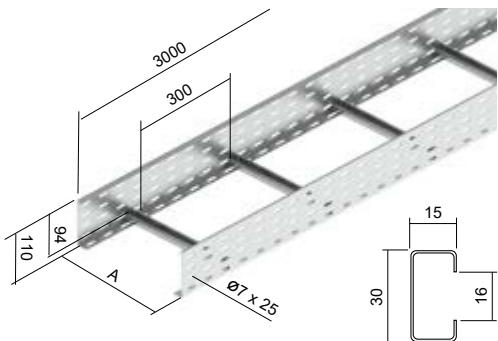

- The ladders are connected using S 60X200 couplings and 8 to 16 pieces of NSM 6X10 bolts.
- Perforated sides form L-profile with a bent edge. The C profile perforated cross-pieces are attached to the sides by extrusion with a spacing of 300 mm, with open side of the profile facing up
- The NPZ 50 partition can be used for the spatial separation of cables. The partition is fastened every 600 mm with NSM 6X20 bolts.
- Cable ladders accessories can be replaced by JUPITER cable trays accessories.
- We are able to provide fiber cement boards on request.
- The following applies to accessories for standardized constructions:
 - side height 60 mm
 - max. cable ladder width is 400 mm

horizontal side coupling

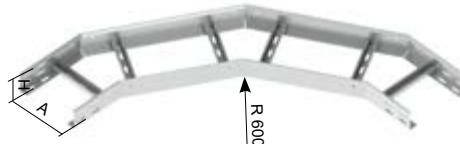

- It is used to create a branch of a cable ladder route or as a replacement for cable ladder fittings or to create route at different angles and different bending radius. Couplings are a more cost-effective and versatile way to create a horizontal bend.
- When bending the route, the side of the cable ladder is cut off approx. 15 mm above the bottom - in the axis of the lower row of perforations.
- The edge must be equipped with NCH edge protector.
- The connection is fixed with NSM 6X10 bolts.

cross

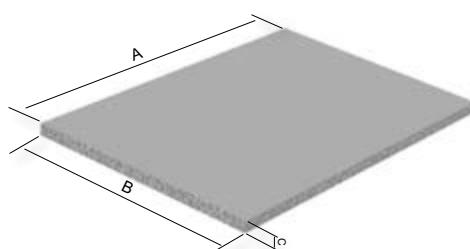

- The cross is connected to the ladder using S 60X200 or S 110X200 couplings and NSM 6X10 bolts.
- The cross can be replaced by a cross of the JUPITER cable tray system.
- The following applies to accessories for standardized constructions:
 - side height 60 mm
 - max. cable ladder width is 400 mm

cement fiber board

- Board for filling cable ladders. Permanent protection of electrical installations.
- Resistance to electric arc according to ČSN 332000-5-52 ed.2.
- Fire resistance - reaction to fire class A1.
- Frost resistance.
- Weather resistance.
- High strength.
- Hygienic safety.
- Items to order.

cable clamps cover

- The KPS 160X... enclosure includes insulating wool and a bucket with insulating putty.
- For the KPS 200X... it is necessary to order the KPS-STOP_PO insulating putty in a 2 kg bucket.
- Anchoring to the base material using the MS KPS mounting kit.
- One mounting kit must be ordered to install the cover.

wire cable trays

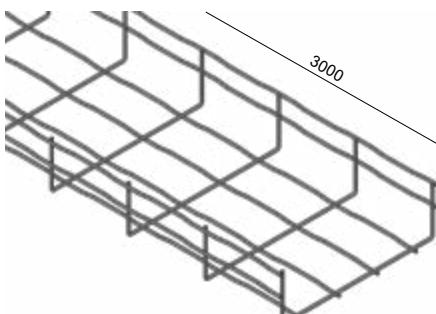

wire tray with integrated coupling

- Each wire tray is equipped with coupling at one end - up to a width of 200 mm there are connectors on the sides, from a width of 300 mm there are connectors on the sides and in the bottom of the tray.
- This connection meets the conductive connection. The DZI wire tray with fire resistance is secured with a DZS/B bolt.
- Due to cable ventilation, it is recommended to install trays at a distance of 250 mm from each other and 20 mm from the wall.

supporting profile

- The supporting profile is intended for creating a cable tray support structure on threaded rods or for creating a route together with PKC1 clamps.

With PKC1 clamps:

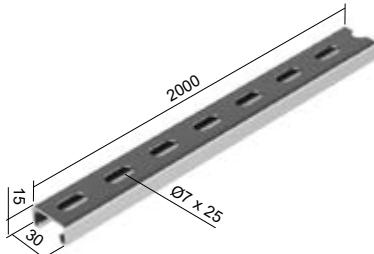

- The supporting profile is anchored to the wall with a maximum spacing of 600 mm using KPO 6 anchors or SB 6.3X35 concrete screws. The spacing of the anchoring elements is max. 250 mm. The cables are attached to the support profile using PKC1 clamps (max. 3 cables in one clamp). The route can also be used as vertical.

With cable tray:

- The supporting profile is fixed with two ZT 8 threaded rods + M 8 nuts + PD 8 washers. The cable tray is fastened to the support profile with NSM 6X10 bolts.

metal dowel

- For suspended installation in concrete, aerated concrete, vertically perforated bricks, natural stone with a solid structure, solid blocks of aerated concrete, sand-lime bricks.
- The external toothed spreader spreads into the building material when the screw is screwed in, thus ensuring high load capacity. The screw must be screwed in to the full length of the dowel. The length of the screw is calculated: the length of the dowel + the diameter of the screw + the thickness of the anchoring part + the thickness of the plaster or insulation.
- The ribbed internal shape of the dowel is suitable for KVP screws. When used in fire-resistant systems, the SB 6.3X35 screw is used together with the KHP 8X38 dowel or KVP screws.
- A - hole diameter
- B - minimum hole depth
- C - dowel length
- D - screw diameter

KHP dowel screw

- The screw is suitable for combination with a KHP dowel - they meet the fire resistance for up to 90 minutes. This combination is ideal for anchoring 67XX_PO clamps in aerated concrete.
- As standard, the screw is designed for use in chipboard and other wood materials.
- The screw has a countersunk head and a cross groove PZ.

PRODUCTS

pipes, trunkings, parapet channels and others

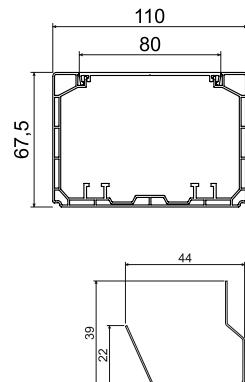

parapet channel PK 110X65 D HF, accessories

HF

- Designed for installation of power and communication circuits, security lines and other distributions.
- The individual lines can be electromagnetically shielded by inserting a shielding channel, which is fastened to the parapet channel using PSK 1 clamps.
- For classic devices that are installed in a closed instrument box KP 80 PK HF snapped into the body of the channel, or in an open instrument box KP PK HF installed in the bottom of the channel.
- It is not necessary to use instrument washers for the final installation of the device. The lid is cut to the required length and attached to the instrument.
- For the installation of devices with very rounded corners, KOPOS recommends using the KP PK HF instrument box and drilling a hole in the lid using VPT 64 drill.
- Quick installation of the lid is done by pushing on its center.
- The basis of the supporting construction is a halogen-free parapet channel PK 110X65 D HF equipped with a metal partition wall PEP 60/K. The partition is attached to the wall through the parapet channel using KPO 6 anchors. The parapet channel can be used to create route with requirements for maintaining functionality in the event of a fire in areas where are higher aesthetic requirements.

► halogen-free rigid pipes

- Halogen-free rigid pipe suitable for residential and industrial distribution.
- From a fire point of view, halogen-free pipes are used in areas with an emphasis on the safety of people and property, eg: public buildings, hospitals, schools, theaters, airport halls, shopping centers, etc.
- Tubes with diameters of 50 and 63 mm are supplied with no socket at one end.
- **Black pipes are UV stable.**
- Can be installed in areas with a risk of explosion of flammable gases and vapors in zone 2 and in areas with a risk of explosion of flammable dusts in zone 22.

* min. sales quantity - 300 m

► couplings for halogen-free rigid pipes

- The couplings are intended for connecting pipes.
- Can be installed in areas with a risk of explosion of flammable gases and vapors in zone 2 and in areas with a risk of explosion of flammable dusts in zone 22.
- **Black couplings are UV stable.**

► bend 90°

- The elbow is used to create a 90° turn in the horizontal direction.
- The connection is made by sliding the cable tray directly into the accessories and then fixing it with NIXSM 6X10 bolts.
- For the NIXO 90X100X500 elbow, the outer right angle of the sides is replaced by a chamfer.

standards and regulations

The entire system of cable trays, cable ladders and accessories is tested in EZÚ (Electrotechnical Testing Institute) and meets the requirements of the standard ČSN EN 61537:02 – Cable management – cable ladder systems and cable grid systems.

All products comply with EU requirements.

In terms of fire resistance, cable trays, ladders and others are tested according to ČSN 73 0895, DIN 4102-12 and STN 9202-14.

surface treatments and protection against corrosion

One of the important criteria in the selection of cable bearing systems is the choice of the correct surface treatment of the products and thus the prevention of corrosion. A common method of protecting steel against corrosion is to create protective coatings that provide a barrier between the steel and the corrosive environment. The most frequently used metal, which is able to ensure the long-term life of a steel part in protection against atmospheric corrosion, is zinc. Depending on the environment in which the system will be used, it is necessary to choose the correct method of applying the zinc protective layer. If anti-corrosion surface treatments are not sufficient for the requirements, stainless steel products are available.

The requirements for surface treatment are not always only protective, for aesthetic or distinguishing reasons, it is possible to paint the products.

S PO	Continuous galvanizing by the Sendzimir method – ČSN EN 10346, ČSN EN 10143 A method of galvanizing, where a cold-rolled steel strip passes through a zinc bath after degreasing, pickling and annealing. The zinc layer is leveled and smoothed with scraper knives and the sheet is wound into coils. The products are therefore made from coils or sheets already protected with a layer of zinc. Factory cuts are protected by cathodic protection. This means that the zinc ions will move to the damaged part of the steel sheet. The sheet metal used for KOPOS products has a coating designation of Z275, which corresponds to a zinc layer of 13-27 µm. The surface treatment is used on cable trays, cable ladders, fittings and accessories for cable routes. Suitable for indoor environments. 															
ZNCR BZNCR	Electrolytic (galvanic) galvanizing - ČSN EN ISO 2081, ČSN EN 12329, DIN 50961 Galvanic galvanizing is an electrolytic process in which a zinc coating is precipitated on the finished steel product in an electrolytic bath. The zinc coating layer is 8-12 µm thick. To increase corrosion resistance, the zinc layer is passivated with chrome as standard. The resulting surface is smooth and shiny. The surface treatment is used on wire cable trays and fixing and connecting material. Suitable for indoor environments. 															
ZM	Continuous galvanizing with addition of magnesium and aluminium - EN 10346, EN 10143 The material is produced on a conventional hot-dip galvanizing line, the molten bath has a unique chemical composition with the addition of magnesium and aluminium. The products are manufactured from coils or sheets of sheet metal that has already been coated. The coating has a self-repairing capability that will provide progressive protection to the cuts in the material. In the first phase, visible signs of corrosion are possible at the cutting points, which, over time, due to the chemical composition, are covered by the protective layer. The sheet metal used for KOPOS products has a coating designation of ZM310, which corresponds to 18-31 µm. The coating is used on cable trays, cable ladders, fittings and cable route accessories. Suitable for indoor and outdoor environments. The surface treatment is suitable to replace hot-dip galvanized products. 															
F POF BF	Hot dip galvanizing – ČSN EN ISO 1461 Finished steel products are chemically prepared to a metallic clean surface through several processes and then immersed in a bath of molten zinc. In the bath, a metallurgical reaction will occur between zinc and iron, during which several protective layers of iron and zinc alloys are formed on the surface of the product. The thickness of the protective coating depends on the chemical composition of the steel and the thickness of the material. <table border="1" style="width: 100%; border-collapse: collapse;"> <thead> <tr> <th style="text-align: center;">thickness of the material – t (mm)</th> <th style="text-align: center;">average coating thickness (µm)</th> <th style="text-align: center;">minimum thickness from a single measurement (µm)</th> </tr> </thead> <tbody> <tr> <td style="text-align: center;">t < 1,5</td> <td style="text-align: center;">45</td> <td style="text-align: center;">35</td> </tr> <tr> <td style="text-align: center;">1,5 ≤ t ≤ 3</td> <td style="text-align: center;">55</td> <td style="text-align: center;">45</td> </tr> <tr> <td style="text-align: center;">3 < t ≤ 6</td> <td style="text-align: center;">70</td> <td style="text-align: center;">55</td> </tr> <tr> <td style="text-align: center;">t > 6</td> <td style="text-align: center;">85</td> <td style="text-align: center;">70</td> </tr> </tbody> </table>	thickness of the material – t (mm)	average coating thickness (µm)	minimum thickness from a single measurement (µm)	t < 1,5	45	35	1,5 ≤ t ≤ 3	55	45	3 < t ≤ 6	70	55	t > 6	85	70
thickness of the material – t (mm)	average coating thickness (µm)	minimum thickness from a single measurement (µm)														
t < 1,5	45	35														
1,5 ≤ t ≤ 3	55	45														
3 < t ≤ 6	70	55														
t > 6	85	70														
Directly after the hot-dip galvanizing process, the appearance of the product is glossy with a typical zinc bloom. Due to air humidity and the passage of time, an oxidized layer begins to form on the surface, thanks to which the appearance gets a dull and darker color. It is a natural stabilization process of surface treatment. Hot-dip galvanized products may have various indentations or imperfections after being removed from the zinc bath. Most of these „defects“ are only aesthetic and conform to the norm. In order to preserve the functionality of the products, some imperfections are adjusted, for example by sanding, or some places are coated with zinc paint. Everything is in accordance with the standard and with regard to the functionality and corrosion resistance of the product. Due to hanging, non-perforated or inappropriately perforated parts are supplemented with a technological hole. The surface treatment is used on cable trays, cable ladders, wire cable trays and accessories for cable routes. Suitable for external environments, or for internal environments with higher humidity.																

surface treatments and protection against corrosion

GMT

GEOMET

The surface treatment was developed for the automotive industry, but thanks to its thin, yet very protective layer, it is mainly used for connecting material and smaller components.

Steel products chemically freed of impurities are immersed in a bath with zinc-aluminum microlamellas, after removing excess material, the surface is hardened in an oven. The protective layer is 5-15 µm thin and has a matte gray surface.

Salt fog test results show better resistance than hot-dip galvanized products, therefore this surface treatment is suitable as an alternative and supplement for hot-dip galvanized products.

Surface treatment is used on connecting material and smaller accessories.

Suitable for external environments, or for internal environments with higher humidity.

IX

Stainless steel – A2, AISI 304, DIN 1.4301, ČSN 17 240

Chromium-nickel austenitic steel (food grade steel) is ideal for use in the chemical or food industry. Steel is resistant to water, water vapor, air humidity, edible acids and weak organic and inorganic acids. It resists weather effects except of coastal areas or environments where there is a higher concentration of aggressive chemicals.

Most parts are outside covered with a protective film.

It is also possible production from AISI 316 steel on request too.

EO

EC

Powder varnish

Epoxy-polyester powder paint is applied in an electrostatic field to the galvanized product and then the paint is harden in an oven. In this way, a smooth uniform surface with high corrosion resistance is created.

The main reason for painting products is aesthetic requirements or the possibility of color differentiation of routes. Painting has also very good resistance to corrosion, during tests in salt fog it showed better resistance than hot-dip galvanizing.

Considering the price, most parts will be painted only from the visible side (EO) - cable trays, fittings. Supporting products and products that cannot be painted only from visible side are painted all over the entire surface (EC). Threaded products cannot be painted.

To determine the price, it is necessary to state the desired color according to the RAL sample. The colors are divided into several price groups and the price is determined directly for the given order. If the RAL color is not specified, the price is calculated for the basic white color RAL 9010 in a matte finish.

Painted products are not in stock as standard, the painting process is made on request.

The surface treatment can be used for most continuously or electrolytically galvanized products from the system. Hot-dip galvanized products can only be painted only under specific conditions.

Areas of cable trays, accessories or support systems that have been damaged by cutting, drilling or otherwise should be treated with zinc spray or zinc paint.

corrosive aggressiveness of the environment

The protective coating of the material decreases over time and its rate of decreasing depends on the corrosive aggressiveness of the environment. The corrosion rate of zinc depending on the environment is given in the table according to ČSN EN ISO 9223.

level of corrosion aggressiveness		description of the environment	average corrosion depletion of the zinc thickness (µm / year)	recommended surface finish
C1	very low	Interior: dry, ventilated, air-conditioned spaces - offices, residential spaces, shops, schools, hotels	<0,1	S, PO, ZNCR, BZNCR EO, EC
C2	low	Interior: ventilated spaces with unstable temperature and possible occasional humidity - sports, production and storage halls, garages Exterior: dry, unpolluted places with very moderate occasional humidity - free landscape	0,1 - 0,7	S, PO, ZNCR, BZNCR - limited ZM, F, POF, GMT IX, EO, EC
C3	medium	Interior: production areas with higher humidity and medium pollution - food areas, dairies, breweries, laundries Exterior: urban and industrial areas with low to medium air pollution, coastal areas with low salinity	0,7 - 2,1	ZM, F, POF, BF, GMT IX, EO, EC
C4	high	Interior: areas with higher condensation and heavy pollution - swimming pools, chemical areas Exterior: industrial areas, coastal areas with medium salinity	2,1 - 4,2	ZM, F, POF, BF, GMT IX, EO, EC
C5	very high	Interior: areas with very high condensation or heavy pollution from production processes and mines Exterior: industrial areas with high pollution and humidity, seaside areas with high salinity	4,2 - 8,4	ZM, F, POF, BF GMT - limited IX, EO, EC

mechanical resistance

Cable trays are designed, constructed and type tested according to ČSN EN 61537 so they provide, where it is required, a reliable mechanical protection for insulated wires, cables, cords and possibly other electrical devices contained in them. Furthermore, these trays will withstand the stresses which will probably occur during the classified minimal temperature for storage, transport, installation and application. The screwed connections and other mechanical connections will withstand the mechanical stressing during installation and normal use.

Load carrying capacity - loading of the tray

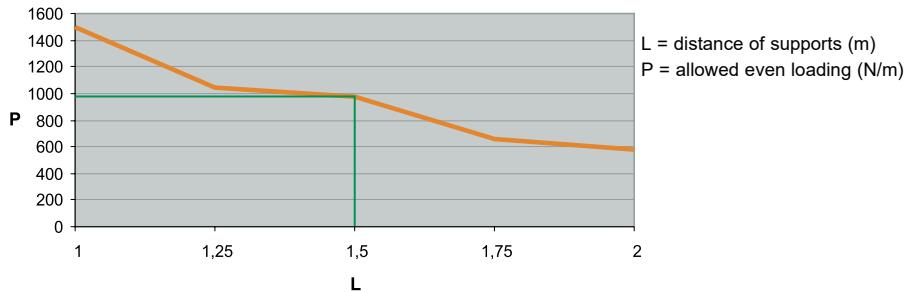

The loading of cable trays must be adequate with regards to the expected weight of the cables.

The trays are not designed to be walked on. The loading of the trays is effected by the distance of the load bearing supports and also the width of the supports for the wall and the length of the hanger.

- the loading decreases with the increased span of the supports
- the shorter the wall support the lesser the tray bend

Example of a display of a loading graph (NKZI 50X125)

With the placing of the supports at a distance of 1.5 m the maximum possible loading of the tray NKZI 50X125 is 1000 N/m.

electrical conductivity and grounding

The system of cable trays and ladders is designed in such a way that a high-quality connection is ensured when the individual parts are connected. This is achieved by a solid connection using special NSM 6X10 screws. The claim is based on the test report concerning cable routes and cable ladders classed under the ČSN EN 61357 standard pursuant to Article 6.3.2 as cable routes with the characteristics of electrical continuity to ensure protective bonding and ground connection. Under Article 11.1.2 25A + - 1A alternating current at a frequency of 50 Hz to 60 Hz is fed along the length of the test samples. The test performed under this article was compliant. Impedance on the circuit board is less than 50 mΩ. The cable trays and cable ladders were also found to be compliant during this test. When using the KSV clamp it is necessary to connect individual parts (trays, accessories) by an additional protective wire with the corresponding cross section. Wire cable trays connected by integrated coupling or firmly connected by the DZS/B connection set or possibly DZSP/B connection reinforcement also meet the above requirements.

electrical conductivity and grounding

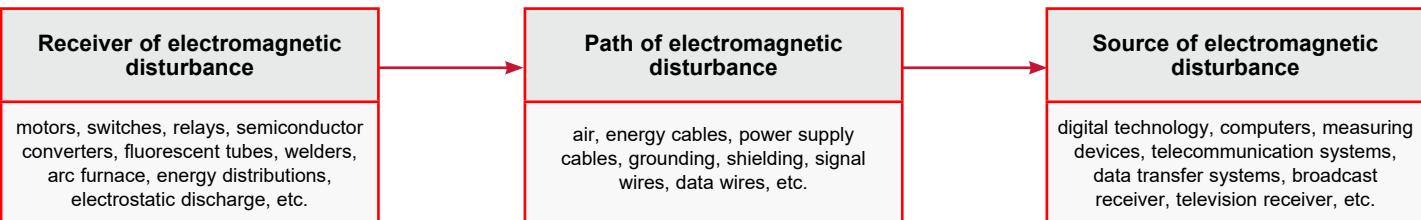

For safety reasons, the system of trays bonded in this way shall be on both ends connected to a ground clamp. This connection must meet the requirements of the standard ČSN 33 2000-4-54 ed.3 art.543.1. (The minimum cross-section of the protective conductor must either be calculated in accordance with Article 543.1.2 or must be selected according to Table 54.2).

electromagnetic compatibility

The cable tray systems are frequently operated in an industrial environment which exhibits a high level of external electromagnetic effects. Due to this reason it is necessary to maintain certain rules which will secure a perfect function of the system.

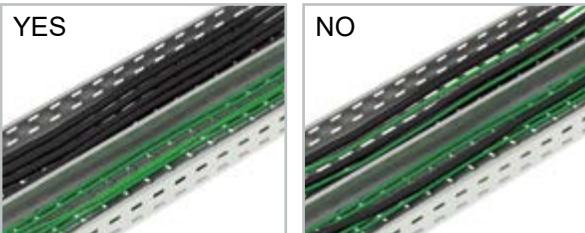

Electromagnetic compatibility (from the English Electromagnetic Compatibility, abbreviation EMC) is the capability for a device or system to exhibit the proper function also in an environment where sources of electromagnetic signals are acting. At the same time this device or system should not be the source of non-permissible electromagnetic disturbance.

Relation between the source of the disturbance and the disturbed equipment.

In order to reach a good level of electromagnetic compatibility it is necessary to remove or to lessen as much as possible one of these elements.

A properly connected and grounded system of cable trays "MARS" is properly secured against external electromagnetic discharge. The trays which are closed with a cover then act as shielding channels. It is necessary to only maintain certain rules inside the tray, where individual cables can act as a source and others as receivers of electromagnetic disturbance.

For the limiting or complete removal of the effect of electromagnetic compatibility the basic condition is the separation of the power and data cables in the scope of a single tray. This can be achieved by several ways:

1. Separate individual lines using a metal partition NPZ 50 or NPZ 100
2. Do not place the data and power distributions together in one tray
3. If within the scope of a single sheet metal tray there occurs the placing of various types of lines, which could mutually affect each other, then it is necessary to maintain between them a minimum space of 20 cm.

cables - recommendation for their installation

The metal cable trays are a universal carrier for all types of cables, from high-current to low-current.

- **for high-current cables** it is necessary to pay attention to the resistance of the cable and the subsequent development of heat, for these cables a wider tray with a lower sidewall is more suitable.
- **for data cables** it is necessary to prevent the effect of electromagnetic waves by shielding. For these cables the narrower trays with a higher sidewall are suitable. The design of certain types of data cables secures by itself a partial resistance against electromagnetic disturbance (for example the shielded double line STP, coaxial cables etc)
- **for optic cables**, which by their principle are resistant to electromagnetic disturbance, it is necessary to maintain the minimum bending ratio in order to maintain their correct function.

When laying cables into cable supporting trays "MARS" it is necessary to consider the method of placing and to consider the requirements of the standards ČSN 33 2000-4-43, ČSN 33 2000-4-473 during the installation. According to these standards, permanent wire and cable current-carrying capacity can be determined with respect to their installation, mutual position and the ambient temperature.

In order to prevent the mutual interference of the installed cables, it is recommended to observe the principles described in the chapter Electromagnetic Compatibility (separate data and power lines etc.). It is also recommendable to band individual cables or cable bundles and to attach them to the cable tray proper. In particular, cables are attached inside the cable tray if the system of cable trays is not only horizontal but the route also rises or descends. Furthermore, the power cables for which high current loading and current surges are expected shall also be fixed.

packaging and storage

The straight parts are firmly fixed on the pallets with elastic polypropylene tape, the other material is stored in boxes.

Scope of validity:

These conditions apply to the storage of metal products manufactured by KOPOS KOLÍN a.s. and comply with the standard ČSN EN IEC 60721-3-1 ed. 2 Classification of environmental conditions - Part 3-1: Classification of groups of environmental parameters and their levels of severity - Storage

In general

1. Products must be protected against harmful influences, such as mechanical damage, weather or chemical influences.
2. The longest-stored products (FIFO system) must be removed from storage.
3. Products stored must be properly and visibly marked in the store to prevent confusion.

Storage requirements

The products must be stored in a dry, dust-free environment to prevent damage.

Warehouse specifications:

- A place completely protected from the weather, ie in a closed place where the direct effects of the weather are completely excluded.
- The presence of water from sources other than rain must be completely ruled out: dripping water, gushing water, condensate.
 - Complete elimination of chemical influences caused by salt aerosols.
